DEPARTMENT OF

COMPUTER SCIENCE & ENGINEERING

CS333 Application Software Development Lab

(AY:2019-2020)

LAB MANUAL

Version number:1.1

Prepared by:

Dr CK Raju

Professor, Department of CSE

VISION

To be recognized as a socially accountable thought leader in applications of computational technologies and a centre of excellence in solving complex and cross-disciplinary problems.

MISSION

- Develop pedagogical practices that help equip students with the ability to self-learn and reason.
- Improve ability to communicate on complex engineering activities and interpersonal skills by developing proper training methods and professional networking.
- Improve problem solving ability by promoting computational thinking and working on cross-disciplinary projects.
- Create and sustain networks in professional, academic and startup environments to stay updated with changes in the field of Computer Science and Engineering.
- Instill social commitment in students and faculty by engaging in spreading computer literacy and other socially relevant services.
- Promote research towards developing insight into complex problems.

Course outcome	
CS333.1	Students should be able to perform basic DDL, DCL, DML, DQL and TCL commands
CS333.2	Students should be able to realise built-in, aggregate functions and conditional queries
CS333.3	Students should be able to implement views, triggers, stored procedures and functions
CS333.4	Students should be able to design and implement database project using forms menus and reports

Experiment	Course outcome
1. Creation of Database using DDL	CS333.1
2. Performing DML Comands	CS333.1
3. Retrieving information using DQL	CS333.1
4. Creating relationship within databases	CS333.1
5. Creating a database to set various constraints	CS333.1
6. Practise of TCL commands like Rollback, Commit, Savepoint	CS333.1
7. Performing DCL commands – granting/revoking privileges	CS333.1
8.Creation of Views and Assertions	CS333.3
9. Implementation of built-in functions in RDBMS	CS333.2
10. Implementation of various aggregate functions in SQL	CS333.2
11.Implementation of Order by, Group by and Having clause	CS333.2
12. Implementation of set operations, nested / join queries	CS333.2
13. PL/SQL – Creation of Stored Procedures and Functions	CS333.3
14. Creation of Database Triggers and Cursors	CS333.3
15. Practise of front-end tools with report generation	CS333.4
16. Creating Forms and Menus	CS333.4
17. Mini Project	CS333.4

Contents

1 Creation of Database using DDL

```
1
2  -- DDL Commands - Creating Database, Tables
3
4  -- Create new database
5
6  CREATE DATABASE institution;
7
8  USE institution;
9
10 -- Relations
11
12 -- Consider the following relations:
13
14 -- Student (snum: integer, sname: string, major: string, level:
       string, age: integer)
15
16 -- Class (name: string, meets at: string, room: string, fid:
       integer)
17
18 -- Enrolled (snum: integer, cname: string)
19
20 -- Faculty (fid: integer, fname: string, deptid: integer)
21
22 -- The meaning of these relations is straightforward; for example
       , Enrolled has one record per student-class pair such that
       the student is enrolled in the class. Level is a two
       character code with 4 different values (example: Junior: JR
       etc)
23
24
25 -- Creating Student table
26
27 CREATE TABLE Student (
28      snum INT,
29      sname VARCHAR(15),
30      major VARCHAR(15),
31      slevel VARCHAR(15),
32      age INT,
33      PRIMARY KEY (snum)
34 );
35
36 DESC Student;
37
38
39 -- Creating Faculty table
40
```

```
41 CREATE TABLE Faculty (
42     fid INT,
43     fname VARCHAR(15),
44     deptid INT,
45     PRIMARY KEY (fid)
46 );
47
48 DESC Faculty;
49
50
51 -- Creating Class table
52
53 CREATE TABLE Class (
54     cname VARCHAR(15),
55     meets_at VARCHAR(15),
56     room VARCHAR(15),
57     fid INT,
58     PRIMARY KEY (cname),
59     FOREIGN KEY (fid) REFERENCES Faculty (fid)
60 );
61
62 DESC Class;
63
64
65 -- Creating Enrolled table
66
67 CREATE TABLE Enrolled (
68     snum INT,
69     cname VARCHAR(15),
70     FOREIGN KEY (snum) REFERENCES Student (snum),
71     FOREIGN KEY (cname) REFERENCES Class (cname)
72 );
73
74 DESC Enrolled;
```

2 Performing DML commands like Insertion, Deletion, Modifying, Altering and Updating records based on conditions

```
--DML Commands :  Insertion, Deletion, Modifying, Altering and
    Updating Records based on conditions

-- Filling Student table with values

INSERT INTO Student VALUES
        (2, 'Rishabh', 'EC', 'SR', 20),
        (3, 'Aditya', 'CS', 'SR', 20),
        (4, 'Siddharth', 'CS', 'JR', 18),
        (5, 'Amit', 'CS', 'SSR', 22),
        (6, 'Gargi', 'EC', 'SJR', 17)
    ;

-- Filling Faculty table with values

INSERT INTO Faculty VALUES
        (55, 'Prof. Venkatasen', 7),
        (66, 'Prof. Prasad', 7),
        (77, 'Prof. Anupama', 8),
        (88, 'Prof. Poornima', 9),
        (99, 'Prof. Anil', 9)
    ;

-- Filling Class table with values

INSERT INTO Class VALUES
        ('CS1', '12 HR', 'R128', 55),
        ('CS2', '11 HR', 'R138', 66),
        ('CS3', '12 HR', 'R148', 77),
        ('CS4', '11 HR', 'R158', 88),
        ('CS5', '12 HR', 'R168', 99),
        ('CS6', '1 HR', 'R138', 55),
        ('CS7', '2 HR', 'R148', 55),
        ('CS8', '3 HR', 'R158', 55),
        ('CS9', '4 HR', 'R168', 55)
    ;

```

```
43
44 -- Filling Enrolled table with values
45
46 INSERT INTO Enrolled VALUES
47         (2, 'CS1'),
48         (3, 'CS2'),
49         (4, 'CS1'),
50         (5, 'CS4'),
51         (6, 'CS5');
```

3 Retrieving information using DQL

```
1
2
3   SELECT * FROM Student;
4
5   SELECT * FROM Faculty;
6
7   SELECT * FROM Class;
8
9   -- Find the names of all Juniors (level = JR) who are enrolled in
        a class taught by Prof. Venkatesan
10
11  SELECT DISTINCT S.sname
12  FROM Student S, Enrolled E, Class C, Faculty F
13  WHERE
14      S.snum = E.snum AND
15      E.cname = C.cname AND
16      C.fid = F.fid AND
17      F.fname LIKE '%Venkatesan%' AND
18      S.slevel = 'JR'
19  ;
20
21  -- Find the names of all classes that either meet in room R128 or
        have five or more Students enrolled.
22
23  SELECT DISTINCT C.cname
24  FROM Class C
25  WHERE
26      C.room = 'R128' OR
27      C.cname IN (
28              SELECT E.cname
29              FROM Enrolled E
30              GROUP BY E.cname
31              HAVING COUNT(*) >= 5
32          )
33  ;
34
35  -- Find the names of all students who are enrolled in two classes
        that meet at the same time.
36
37  SELECT DISTINCT S.sname
38  FROM Student S
39  WHERE S.snum IN (
40              SELECT E1.snum
41              FROM Enrolled E1, Enrolled E2, Class C1, Class C2
42              WHERE
43                  E1.snum = E2.snum AND
```

```
44                      E1.cname <> E2.cname AND
45                      E1.cname = C1.cname AND
46                      E2.cname = C2.cname AND
47                      C1.meets_at = C2.meets_at
48          )
49  ;
50
51  -- Find the names of faculty members who teach in every room in
        which some class is taught.
52
53  SELECT DISTINCT F.fname
54  FROM Faculty F
55  WHERE NOT EXISTS (
56              SELECT *
57              FROM Class C
58              WHERE (C.room) NOT IN (
59                          SELECT C1.room
60                          FROM Class C1
61                          WHERE C1.fid = F.fid
62                      )
63          )
64  ;
65
66  -- Find the names of faculty members for whom the combined
        enrollment of the courses that they teach is less
67  -- than five.
68
69  SELECT DISTINCT F.fname
70  FROM Faculty F
71  WHERE 5 > (
72          SELECT COUNT(E.snum)
73          FROM Class C, Enrolled E
74          WHERE
75              C.cname = E.cname AND
76              C.fid = F.fid
77      )
78  ;
```

4 Creating relationship within databases

```
1  -- Relations
2
3  -- The following relations keep track of airline flight
       information:
4
5  -- Flights (no: integer, from: string, to: string, distance:
       integer, Departs: time, arrives: time, price: real)
6
7  -- Aircraft (aid: integer, aname: string, cruisingrange: integer)
8
9  -- Employees (eid: integer, ename: string, salary: integer)
10
11 -- Note that the Employees relation describes pilots and other
       kinds of employees as well; Every pilot is certified for some
        aircraft, and only pilots are certified to fly.
12
13 -- Creating Flights table
14
15 CREATE TABLE Flights (
16     flno INT,
17     ffrom VARCHAR(15),
18     tto VARCHAR(15),
19     distance INTEGER,
20     departs TIMESTAMP,
21     arrives TIMESTAMP,
22     price REAL,

```

5 Creating a database to set various constraints

```
1
2  -- SQL | Constraints
3
4  -- Constraints are the rules that we can apply on the type of
       data in a table. That is, we can specify the limit on the
       type of data that can be stored in a particular column in a
       table using constraints.
5
6  -- The available constraints in SQL are:
7
8  --     NOT NULL: This constraint tells that we cannot store a
       null value in a column. That is, if a column is specified as
       NOT NULL then we will not be able to store null in this
       particular column any more.
9  --     UNIQUE: This constraint when specified with a column,
       tells that all the values in the column must be unique. That
       is, the values in any row of a column must not be repeated.
10 --     PRIMARY KEY: A primary key is a field which can uniquely
       identify each row in a table. And this constraint is used to
       specify a field in a table as primary key.
11 --     FOREIGN KEY: A Foreign key is a field which can uniquely
       identify each row in a another table. And this constraint is
       used to specify a field as Foreign key.
12 --     CHECK: This constraint helps to validate the values of a
       column to meet a particular condition. That is, it helps to
       ensure that the value stored in a column meets a specific
       condition.
13 --     DEFAULT: This constraint specifies a default value for the
        column when no value is specified by the user.
14
15 CREATE TABLE sample_table
16 (
17 column1 data_type(size) constraint_name,
18 column2 data_type(size) constraint_name,
19 column3 data_type(size) constraint_name,
20 ....
21 );
22
23 -- sample_table: Name of the table to be created.
24 -- data_type: Type of data that can be stored in the field.
25 -- constraint_name: Name of the constraint. for example- NOT NULL
       , UNIQUE, PRIMARY KEY etc.
26
27 -- NOT NULL
28 CREATE TABLE Student
29 (
```

```
ID int(6) NOT NULL,
NAME varchar(10) NOT NULL,
ADDRESS varchar(20)
);

-- UNIQUE
CREATE TABLE Student
(
ID int(6) NOT NULL UNIQUE,
NAME varchar(10),
ADDRESS varchar(20)
);

-- PRIMARY KEY
CREATE TABLE Student
(
ID int(6) NOT NULL UNIQUE,
NAME varchar(10),
ADDRESS varchar(20),
PRIMARY KEY(ID)
);

-- FOREIGN KEY
CREATE TABLE Orders
(
O_ID int NOT NULL,
ORDER_NO int NOT NULL,
C_ID int,
PRIMARY KEY (O_ID),
FOREIGN KEY (C_ID) REFERENCES Customers(C_ID)
);

-- CHECK
CREATE TABLE Student
(
ID int(6) NOT NULL,
NAME varchar(10) NOT NULL,
AGE int NOT NULL CHECK (AGE >= 18)
);

-- DEFAULT
CREATE TABLE Student
(
ID int(6) NOT NULL,
NAME varchar(10) NOT NULL,
AGE int DEFAULT 18
);
```

6 Practise of SQL TCL commands like Roll-back, Commit, Savepoint

```
-- A Transaction is a collection of statements between specific
   client and server. These transactions can be controlled
   efficiently by using MySQL TCL (Transaction Control Language)
   . Transaction Control Statements are

--      Commit
--      Roll-back
--      Save points

CREATE TABLE test(test_id INT NOT NULL PRIMARY KEY) ENGINE=InnoDB
   ;

START TRANSACTION;

INSERT INTO TEST VALUES(1);

SELECT * FROM TEST;

SAVEPOINT TRAN2;

INSERT INTO TEST VALUES(2);

SELECT * FROM TEST;

ROLLBACK TO TRAN2;

SELECT * FROM TEST;

ROLLBACK;

SELECT * FROM TEST;

-- Test working of TCL commands on different tables and observe
   changes.
```

7 Practise of SQL DCL commands for granting and revoking user privileges

```
1  -- DCL- DCL is the abstract of Data Control Language. Data
       Control Language includes commands such as GRANT, and
       concerns with rights, permissions and other controls of the
       database system. DCL is used to grant / revoke permissions on
        databases and their contents.
2
3  -- GRANT : It provides the  user's access privileges to the
       database. In the MySQL database offers both the administrator
        and user a great extent of the control options. By the
       administration side of the process includes the possibility
       for the administrators to control certain user privileges
       over the MySQL server by restricting their access to an
       entire the database or ust limiting permissions for a
       specific table.
4
5  CREATE USER 'arjun'@'localhost' IDENTIFIED BY 'mypass';
6
7  GRANT ALL ON db1.* TO 'arjun'@'localhost';
8
9  GRANT SELECT ON child TO 'arjun'@'localhost';
10
11 GRANT USAGE ON *.* TO 'arjun'@'localhost' WITH
       MAX_QUERIES_PER_HOUR 90;
12
13 -- REVOKE : The REVOKE statement enables system administrators
       and to revoke the privileges from MySQL accounts.
14
15 -- Syntax : REVOKE priv_type [(column_list)] [, priv_type [(
       column_list)]] ... ON [object_type] priv_level FROM user [,
       user] ...
16
17 REVOKE INSERT ON *.* FROM 'arjun'@'localhost';
```

8 Creation of Views and Assertions

```
1  -- VIEWS
2  --    Views are virtual tables; they do not contain the data that
       is returned. The data is stored in the tables referenced in
       the SELECT statement.
3  --    Views improve security of the database by showing only
       intended data to authorized users. They hide sensitive data.
4  --    Views make life easy as you do not have write complex
       queries time and again.
5  --    It's possible to use INSERT, UPDATE and DELETE on a VIEW.
       These operations will change the underlying tables of the
       VIEW. The only consideration is that VIEW should contain all
       NOT NULL columns of the tables it references.
6  --Ideally, you should not use VIEWS for updating.
7
8  -- To create a new view in MySQL, you use the CREATE VIEW
       statement. The syntax of creating a view in MySQL is as
       follows:
9
10 CREATE      [ALGORITHM = {MERGE  | TEMPTABLE | UNDEFINED}] VIEW
       view_name [(column_list)] AS select-statement;
11
12 -- Example
13
14 CREATE VIEW SalePerOrder AS
15     SELECT
16         orderNumber, SUM(quantityOrdered * priceEach) total
17     FROM
18         orderDetails
19     GROUP by orderNumber
20     ORDER BY total DESC;
21
22 -- Examine
23 SHOW TABLES;
24
25 SHOW FULL TABLES;
26
27 -- Observe the differences in both the cases here.
```

9 Implementation of built-in functions in RDBMS

```
1
2
3   -- Verify and explain each of the built-in functions listed
        herein.
4   -- Search another 10 such built-in functions not listed here
5
6   SELECT UCASE(NAME) FROM Students;
7
8   SELECT MID(column_name,start,length) AS some_name FROM table_name
        ;
9   -- specifying length is optional here, and start signifies start
        position ( starting from 1 )
10
11  SELECT LENGTH(NAME) FROM Students;
12
13  SELECT ROUND(MARKS,0) FROM table_name;
14
15  SELECT NAME, FORMAT(Now(),'YYYY-MM-DD') AS Date FROM Students;
16
17  SELECT SUM(ISNULL(Salary, 10000) AS Salary FROM Employee;
18
19  SELECT ABS(-243.5);
20
21  SELECT COS(30);
22
23  SELECT GREATEST(30, 2, 36, 81, 125);
24
25  SELECT LOG(2);
26
27  SELECT MOD(18, 4);
28
29  SELECT TRUNCATE(7.53635, 2);
30
31  SELECT CURRENT_DATE();
32
33  SELECT DAYOFMONTH('2018-07-16');
34
35  SELECT HOUR("2018-07-16 09:34:00");
36
37  SELECT MAKEDATE(2009, 138);
38
39  SELECT CHARACTER_LENGTH('geeks for geeks');
40
41  SELECT CONCAT_WS('_', 'geeks', 'for', 'geeks');
42
43  SELECT LOWER('GEEKSFORGEEKS.ORG');
```

```
44
45 SELECT STRCMP('google.com', 'geeksforgeeks.com');
46
47 SELECT SUBSTRING_INDEX('www.geeksforgeeks.org', '.', 1);
```

10 Implementation of various aggregate functions in SQL

```
-- Aggregate functions:
-- These functions are used to do operations from the values of
    the column and a single value is returned.

--      AVG()
--      COUNT()
--      FIRST()
--      LAST()
--      MAX()
--      MIN()
--      SUM()

-- Examples:
SELECT AVG(MARKS) AS AvgMarks FROM Students;

SELECT COUNT(column_name) FROM table_name;

SELECT COUNT(DISTINCT AGE) AS NumStudents FROM Students;

SELECT FIRST(column_name) FROM table_name;

SELECT LAST(column_name) FROM table_name;

SELECT MAX(MARKS) AS MaxMarks FROM Students;

SELECT MIN(AGE) AS MinAge FROM Students;

SELECT SUM(MARKS) AS TotalMarks FROM Students;
```

11 Implementation of Order By, Group By and Having Clause

```
1
2  -- Relations
3
4  -- The following tables are maintained by a book dealer.
5
6  -- AUTHOR (author-id:int, name:string, city:string, country:
       string)
7
8  -- PUBLISHER (publisher-id:int, name:string, city:string, country
       :string)
9
10 -- CATALOG (book-id:int, title:string, author-id:int, publisher-
       id:int, category-id:int, year:int, price:int)
11
12 -- CATEGORY (category-id:int, description:string)
13
14 -- ORDER-DETAILS (order-no:int, book-id:int, quantity:int)
15
16 -- Creating Author table
17
18 CREATE TABLE Author (
19      authorid INT,

12 Implementation of set operations, nested queries and Join queries

```
1
2  -- SET Operations
3
4  -- UNION Operator
5
6  -- UNION operator allows you to combine two or more result sets
       of queries into a single result set. The following
       illustrates the syntax of the UNION operator:
7
8  DROP TABLE IF EXISTS t1;
9  DROP TABLE IF EXISTS t2;
10
11 CREATE TABLE t1 (
12     id INT PRIMARY KEY
13 );
14
15 CREATE TABLE t2 (
16     id INT PRIMARY KEY
17 );
18
19 INSERT INTO t1 VALUES (1),(2),(3);
20 INSERT INTO t2 VALUES (2),(3),(4);
21
22
23 SELECT id FROM t1 UNION SELECT id FROM t2;
24
25 -- INTERSECT Operator
26
27 -- MySQL does not support the INTERSECT operator. However, you
       can simulate the INTERSECT operator.
28
29 CREATE TABLE t1 ( id INT PRIMARY KEY );
30
31 CREATE TABLE t2 LIKE t1;
32
33 INSERT INTO t1(id) VALUES(1),(2),(3);
34
35 INSERT INTO t2(id) VALUES(2),(3),(4);
36
37 -- INTERSECT simulation
38 SELECT DISTINCT     id  FROM t1    INNER JOIN t2 USING(id);
39
40
41 -- MINUS Simulation
42
```

```
43  -- MySQL does not support MINUS operator. However, you can use
        the MySQL join to simulate it.
44
45  CREATE TABLE t1 (     id INT PRIMARY KEY);
46
47  CREATE TABLE t2 (     id INT PRIMARY KEY);
48
49  INSERT INTO t1 VALUES (1),(2),(3);
50  INSERT INTO t2 VALUES (2),(3),(4);
51
52
53  -- MINUS Simulation
54  SELECT  column_list  FROM   table_1  LEFT JOIN table_2 ON
        join_predicate WHERE  table_2.id IS NULL;
55
56

13 Implementation of various control structures using PL SQL - Creation of Procedures and Functions

```
-- MySQL stored procedure parameters

-- The parameters make the stored procedure more flexible and useful. In MySQL, a parameter has one of three modes: IN,OUT, or INOUT.

 --   IN is the default mode. When you define an IN parameter in a stored procedure, the calling program has to pass an argument to the stored procedure. In addition, the value of an IN parameter is protected. It means that even the value of the IN parameter is changed inside the stored procedure, its original value is retained after the stored procedure ends. In other words, the stored procedure only works on the copy of the IN parameter.

DELIMITER //
CREATE PROCEDURE GetOfficeByCountry(IN countryName VARCHAR(255))
 BEGIN
 SELECT *
 FROM offices
 WHERE country = countryName;
 END //
DELIMITER ;

CALL GetOfficeByCountry('USA');

--    the value of an OUT parameter can be changed inside the stored procedure and its new value is passed back to the calling program. Notice that the stored procedure cannot access the initial value of the OUT parameter when it starts.

DELIMITER $$
CREATE PROCEDURE CountOrderByStatus(
 IN orderStatus VARCHAR(25),
 OUT total INT)
BEGIN
 SELECT count(orderNumber)
 INTO total
 FROM orders
 WHERE status = orderStatus;
END$$
```

```
32 DELIMITER ;
33
34 CALL CountOrderByStatus('Shipped',@total);
35 SELECT @total;
36
37
38 -- an INOUT parameter is a combination of IN and OUT
       parameters. It means that the calling program may pass the
       argument, and the stored procedure can modify the INOUT
       parameter, and pass the new value back to the calling program
       .
39
40
41 DELIMITER $$
42 CREATE PROCEDURE set_counter(INOUT count INT(4),IN inc INT(4))
43 BEGIN
44  SET count = count + inc;
45 END$$
46 DELIMITER ;
47
48 SET @counter = 1;
49 CALL set_counter(@counter,1);
50 CALL set_counter(@counter,1);
51 CALL set_counter(@counter,5);
52 SELECT @counter;
53
54 -- FUNCTION
55
56 -- A stored function is a special kind stored program that
       returns a single value. You use stored functions to
       encapsulate common formulas or business rules that are
       reusable among SQL statements or stored programs.
57
58 -- Different from a stored procedure, you can use a stored
       function in SQL statements wherever an expression is used.
       This helps improve the readability and maintainability of the
        procedural code.
59
60
61 -- Example
62
63 DELIMITER $$
64
65 CREATE FUNCTION CustomerLevel(p_creditLimit double) RETURNS
       VARCHAR(10)
66     DETERMINISTIC
67 BEGIN
68     DECLARE lvl varchar(10);
69
```

```
70      IF p_creditLimit > 50000 THEN
71   SET lvl = 'PLATINUM';
72      ELSEIF (p_creditLimit <= 50000 AND p_creditLimit >= 10000)
        THEN
73          SET lvl = 'GOLD';
74      ELSEIF p_creditLimit < 10000 THEN
75          SET lvl = 'SILVER';
76      END IF;
77
78   RETURN (lvl);
79  END
80
81  -- How to invoke
82
83  SELECT customerName, CustomerLevel(creditLimit) FROM customers
        ORDER BY customerName;
```

14 Creation of Database Triggers and Cursors

```
-- A MySQL trigger is a stored program (with queries) which is executed automatically to respond to a specific event such as insertion, updation or deletion occurring in a table.

-- There are 6 different types of triggers in MySQL:
-- Before UPDATE trigger
-- After UPDATE trigger
-- Before INSERT trigger
-- After INSERT trigger
-- Before DELETE trigger
-- After DELETE trigger

-- Example for before-update trigger
create table customer (acc_no integer primary key,
                                cust_name varchar(20),
                                 avail_balance decimal);

create table mini_statement (acc_no integer,
                              avail_balance decimal,
                    foreign key(acc_no) references customer(acc_no) on delete cascade);

insert into customer values (1000, "Fanny", 7000);
insert into customer values (1001, "Peter", 12000);

-- Trigger definition
delimiter //
create trigger update_cus
      before update on customer
      for each row
      begin
      insert into mini_statement values (old.acc_no, old.avail_balance);
      end; //

-- making updates to activate trigger

delimiter;
update customer set avail_balance = avail_balance + 3000 where acc_no = 1001;
update customer set avail_balance = avail_balance + 3000 where acc_no = 1000;

-- verify whether trigger activated or not
select *from mini_statement;

```

```
41
42 -- example for AFTER-DELETE trigger
43 create table contacts (contact_id int (11) NOT NULL
       AUTO_INCREMENT,
44                              last_name VARCHAR (30) NOT NULL,
       first_name VARCHAR (25),
45                              birthday DATE, created_date DATE,
       created_by VARCHAR (30),
46                              CONSTRAINT contacts_pk PRIMARY KEY (
       contact_id));
47 create table contacts_audit (contact_id integer, deleted_date
       date, deleted_by varchar(20));
48
49 -- Trigger defintion
50
51 delimiter //
52 create trigger contacts_after_delete
53             after delete
54             on contacts for each row
55             begin
56
57                DECLARE vUser varchar(50);
58
59                -- Find username of person performing the DELETE
       into table
60                SELECT USER() into vUser;
61
62                -- Insert record into audit table
63                INSERT into contacts_audit
64                ( contact_id,
65                  deleted_date,
66                  deleted_by)
67                VALUES
68                ( OLD.contact_id,
69                  SYSDATE(),
70                  vUser );
71             end; //
72
73 -- activating trigger
74 delimiter;
75 insert into contacts values (1, "Newton", "Isaac",
76                              str_to_date ("19-08-1985", "%d-%m-%Y
       "),
77                              str_to_date ("23-07-2018", "%d-%m-%Y
       "), "xyz");
78 delete from contacts where first_name="Isaac";
79 insert into contacts values (1, "Newton", "Isaac",
80                              str_to_date ("19-08-1985", "%d-%m-%Y
       "),
```

```
81                                  str_to_date ("23-07-2018", "%d-%m-%Y
    "), "xyz");
82  delete from contacts where first_name="Isaac";
83
84  -- verify activation of trigger
85  select *from contacts_audit;
```
